Top-Level Design Description

Trivia Time is a trivia game where the player must answer ten questions by interacting with the Yoto box. The goal is to get the highest score possible.

Design Pillars

The below design pillars identify the types of fun which are key to the user experience.

- Intellectual Problem Solving
- Discovery
- Application of an Ability

Intellectual Problem Solving	Discovery	Application of an Ability
Players think critically about whether a statement is true or false, weighing what they know before committing to an answer	Players encounter new facts they may never have heard before, making every game a small learning experience	Players draw on existing knowledge to answer correctly, rewarding what they already know

Audience & Marketing

Trivia Time is a single player casual trivia game designed to be played online via the Yoto Player which is a screen-free audio device recommended for children aged 3-12. This game targets the upper end of that age range as the questions have been designed around the 8-12 demographic, assuming a baseline of general knowledge typically acquired by that age group. The screen-free, audio-only format suits this audience well as it encourages active listening and independent play without screen time concerns, which also appeals to the secondary audience of parents who are the actual purchasers of Yoto content.

Core Gameplay

When the card is inserted into the Yoto player 10 questions are picked at random from the question bank. Questions are streamed back to the player in real time. They are True/False questions, so the player navigates using the Yoto's physical knobs, pressing left for false and right for true.

After each answer the player receives instant audio feedback, their score is updated, and the game advances to the next question automatically.

Once all 10 questions have been answered the game ends. The player presses the right knob to hear their final score read aloud.

Controls

Press the right button: Select True/Move forward in game

Press the left button: Select False

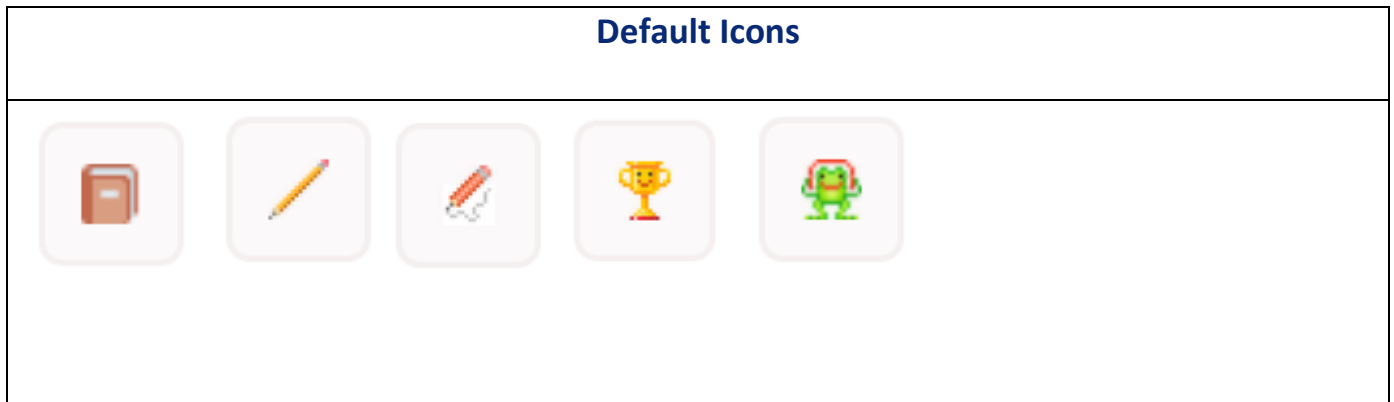

Gameplay Balance & Pacing

The game mechanic is intentionally simple to suit the audio-only format and the target age range. Each session consists of exactly 10 questions, keeping total playtime short and digestible which is well suited to the attention span of the 8-12 demographic. The random question selection ensures no two sessions feel identical which encourages replayability.

Pacing is driven by the player as there is no time limit per question, so players can take as long as they need before answering. When the player is finished answering they will hear feedback. This loop repeats consistently across all 10 questions, providing a predictable structure that feels comfortable rather than stressful.

Tone & Aesthetics

Because Trivia Time is delivered through the Yoto Player, it is primarily an audio experience. Visual design is minimal, so the on-device icons are drawn from the default Yoto library but themed around trivia. The tone is light, encouraging, and age-appropriate for a casual trivia game.

Narrative

This is a singleplayer game without any explicit narrative. I do not intend to characters speaking except for the questions asked to the players.

Business Model

Trivia Time is a free-to-play Yoto game with no monetisation model. It will be made freely available to all users with no ads and no premium tiers.

The game is being developed as a portfolio project to demonstrate skills in game design and development. Its primary value is in the player experience and the learning gained through building it, rather than revenue generation.
