

I wanted to hand draw the sprite, so I began by sketching some ideas.

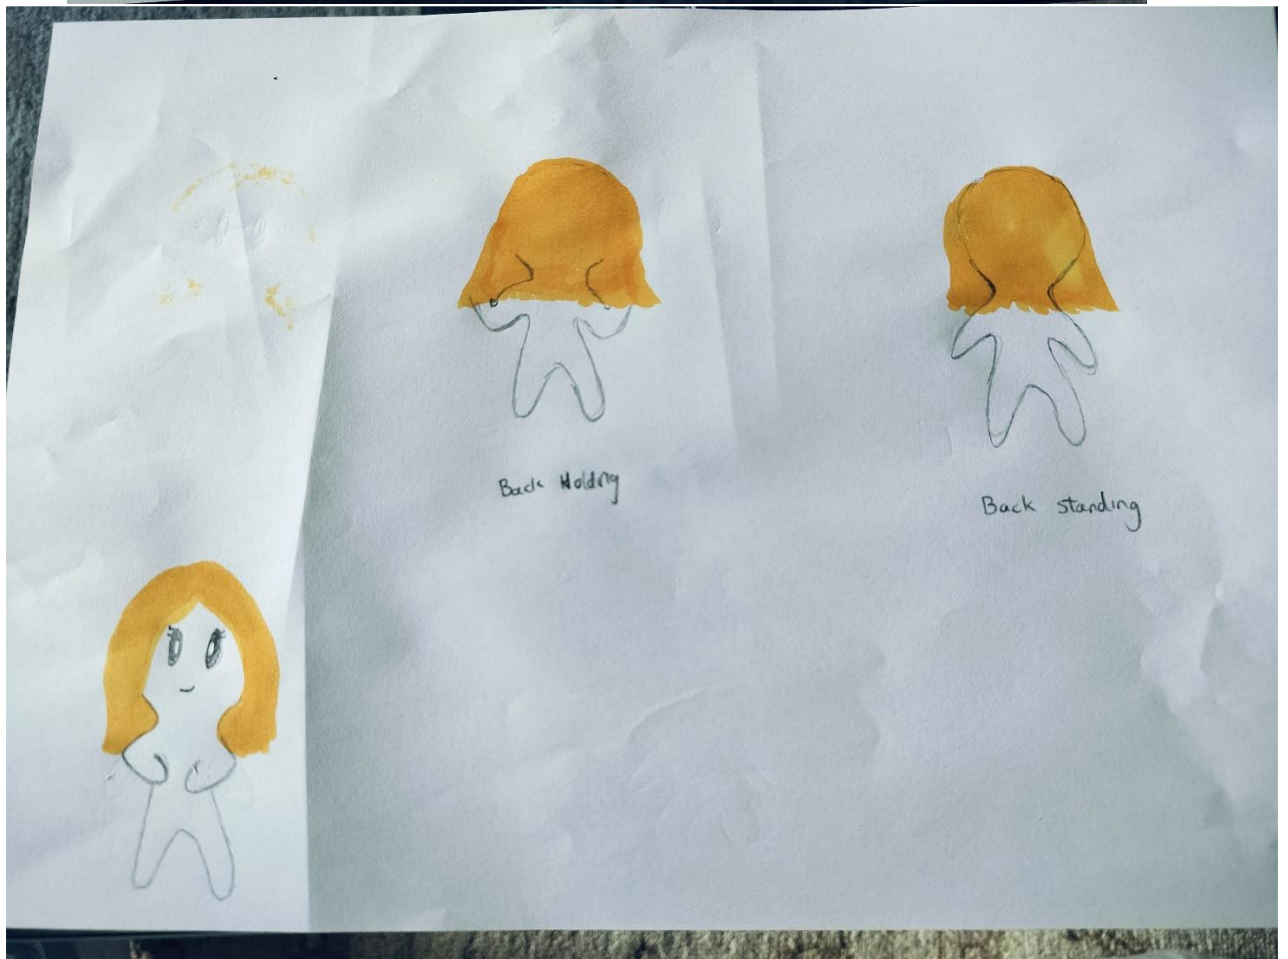

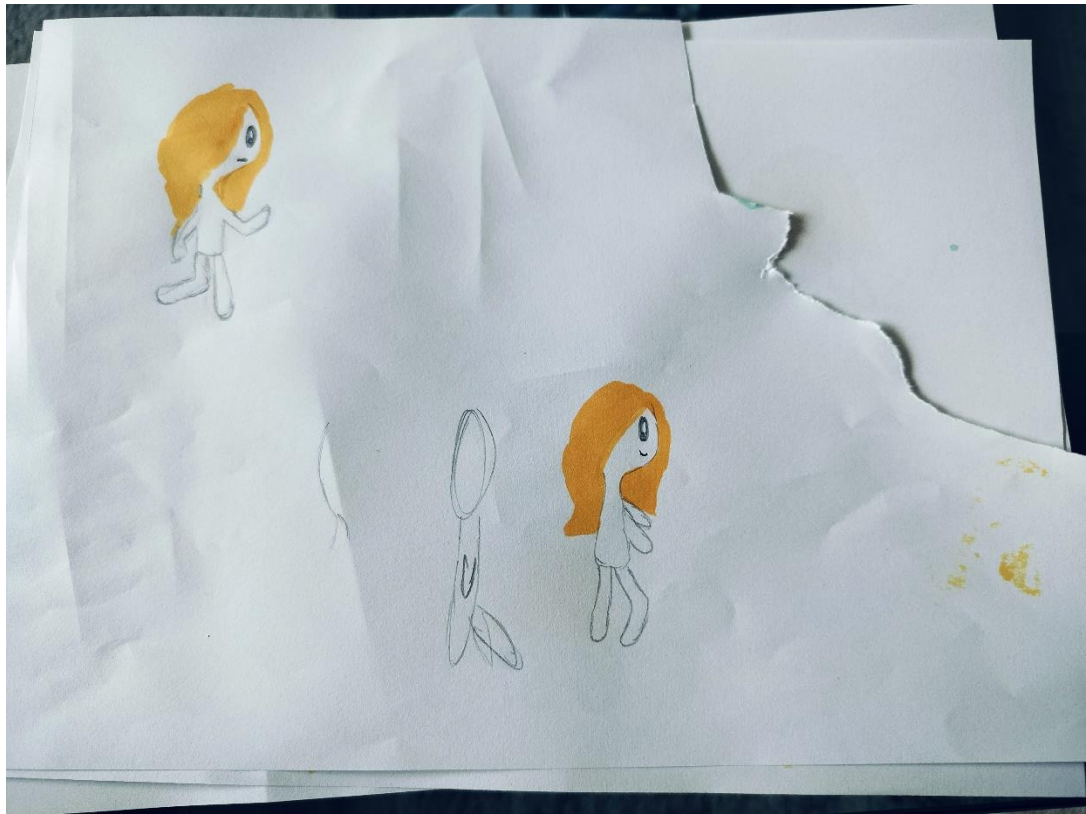

Once I had an idea finalized, I began to sketch each pose that was needed. I decided that I would draw and cut out the outfit individually and just lay that over the sprite when taking the photo instead of drawing it multiple time.

I did need to draw multiple outfits for different angles.

Then I began to carefully tear around each drawing. I wanted each frame to have an imperfect look, like it was torn from a newspaper to be put in a scrapbook.

When I had done this for each drawing I began to put the appropriate outfit on and take photos.

I quickly realized that I had not drawn walking frames for the forward and backward sprites. To fix this I erased and redrew the characters legs to appear as they were walking and took photos in-between. This saved me time as I didn't have to redraw the whole character again but the walking animation still looks good in game.

At this stage I also found 2 interesting objects that could be used in the game so I took photos of them also.

After this I sent all the photos to my computer and removed the backgrounds in all of them. I was happy with the results as the tears around the sprite are still visible and I was worried that would be lost.

I drew the floorboards and bin on <https://piskelapp.com/>. For the bin I recoloured it so I had 2 unique bins.

I also drew the floorboards on piskelapp. I imported it into unity and set it to repeat for my background to make the appearance of wooden floorboards.
